

How to build a home- page in 30 nights

OR: Developing a auto-validating web-application using
AJAX and Python for configuring the PH/SFT Nightly
build system

<elements of="talk">

- Introducing the Nightly Build System
- My project
 - Goals
 - Implementation
 - Structure
 - The result

The Nightly Build System

- Provides daily builds & tests of LCG-AA software
- Multiple architectures (Linux, OSX, WinX86...)
- Configuration of the build process is read from a XML document, edited by hand:
 - Possible content errors (wrong tag name, e-mail etc)
 - Syntax errors in the XML causing total build failure
 - Other practical obstacles for the everyday user (location, file version etc)

My Project

- Implement a configuration tool for the Nightly Build System [NBS]
- Web-based
- Various LCG-AA and LHCb requirements

Goals

- Configure NBS over the web
- Standard CERN provided Linux, i.e. slc4 for the time being
- Validation of critical input
- Cross-browser / platform
- Extendable without too much trouble.
- Well documented (both for users and developers)
- Plug-in structure for adding specific repositories
- Authentication
- Reliable output
- [LHCb]: Fine grained access control
- [LHCb]: Time lock (doing build)
- [LHCb]: Additional elements

Implementation

The screenshot shows the LCG nightly website interface. At the top, there are navigation buttons for SLOTS, PROJECTS, SUMMARY, and HELP. The LCG nightly logo is in the top right corner, along with a welcome message for Morten Dam and links for logout and site config. The main content area displays a 'dev' slot with a list of projects under a 'Projects' dropdown. The projects listed are LCGCMT, ROOT, RELAX, CORAL, POOL, COOL, GAUDIATLAS, GAUDI, and LCGTEST, each with a corresponding '-preview' version. A code snippet is overlaid on the bottom left, showing XML configuration for the 'dev1' slot, including build paths, builders, release paths, and platform definitions.

```
<project name="COOL" tag="COOL-preview" />
<project name="GAUDIATLAS" tag="GAUDIATLAS-preview" />
<project name="GAUDI" tag="GAUDI_HEAD" />
<project name="LCGTEST" tag="LCGTEST-preview" />
</projects>
</slot>
<slot name="dev1" description="dev1 (desealed) ROOT 5.18 patches + other projects de-sealed">
  <builddir path="/build/nightlies/%SLOT%/%DAY%" />
  <buildersdir path="/build/nightlies/%SLOT%/%DAY%/LCGOMT/LCGCMT_55-patches/LCG_Builders" />
  <releasedir path="/afs/cern.ch/sw/lcg/app/nightlies/%SLOT%/%DAY%" />
  <wwwdir path="/afs/cern.ch/sw/lcg/app/nightlies/www/%PLATFORM%" />
  <platforms>
    <platform name="slc4_ia32_gcc34_dbg" />
    <platform name="slc4_amd64_gcc34_dbg" />
    <platform name="slc4_amd64_gcc34" />
    <platform name="osx105_ia32_gcc401_dbg" />
    <platform name="win32_vc71_dbg" />
  </platforms>
  <days mon="true" tue="true" wed="true" thu="true" fri="true" sat="true" sun="true" />
</slot>
</projects>
```

Client side features

- jQuery Framework: Cross-browser JS, adds abstraction to browser specific javascripting
- Movable, deletable and editable elements – position and edit intuitively
- Interactive feedback on events – makes it possible to use trial-and-error without destroying unsaved modifications at other places in the config.
- Ajax “Behind the scene server calls” – Website acts like a regular application
- Novel handling of validation state – Regions with open input fields means unvalidated data, and hence no submitting. If all data is locked down it means that it is verified.
- Namespaced Javascript for future integration (lcg.nightly.core.*)
- Fine-grained user control (Project-level, Slot-level and Site-level) – LHCb specific. Project contacts can be given partial access to their own builds.

Server-side features

- Site management forwarded to CGI/Python
- Apache 1.3, Python 2.3, IT-dep standard webserver (self-contained app)
- New elements represented as XSL-T for easy extension
- Shibboleth Single Sign-On Authentication
- Central configuration file for both front- and back-end (YAML).
- Plugin-structure for future repository types
- E-mail validation against CERN accounts
- Logging of changes (commit configuration to CVS)
- Configuration is validated as proper XML before saving (parses XSL-T,)

Flow structure

```
<?xml version="1.0" encoding="UTF-8"?>
<config>
  <name>test</name>
  <url address="http://www.w3.org/1999/XSL/Transform">
    <output encoding="UTF-8" indent="yes" method="xml" />
  </url>
  <template match="/html/body">
    <general>
      <xsl:for-each select="//div[@id=
        'project name']">
        <project name="{@class='projectName'}">
          <mailto address="{@address}" />
        </project>
      </xsl:for-each>
    </general>
  </template>
</config>
```

XML

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
  <xsl:output encoding="UTF-8" indent="yes" method="xml" />
  <xsl:template match="/html/body">
    <general>
      <xsl:for-each select="//div[@id=
        'project name']">
        <project name="{@class='projectName'}">
          <mailto address="{@address}" />
        </project>
      </xsl:for-each>
    </general>
  </template>
</xsl:stylesheet>
```

XSL

```
<!--><![CDATA[/*<!--*/
body, html {
  font: normal 11px auto "Trebuchet MS", Verdana, Arial, Helvetica,
  color: #4f6b72;
  background-color: #fff;
}
/* Show editable status of active elements */
.editable {
  border: transparent 1px solid;
}
.editable:hover,
.editable:active,
.editable:focus {
  border: 1px solid #999;
  cursor: pointer;
}
.verified {
  color: red;
}
.unverified {
  color: red;
}
#general {
  /* ... */
}
.page {
  display: none;
}
}
```

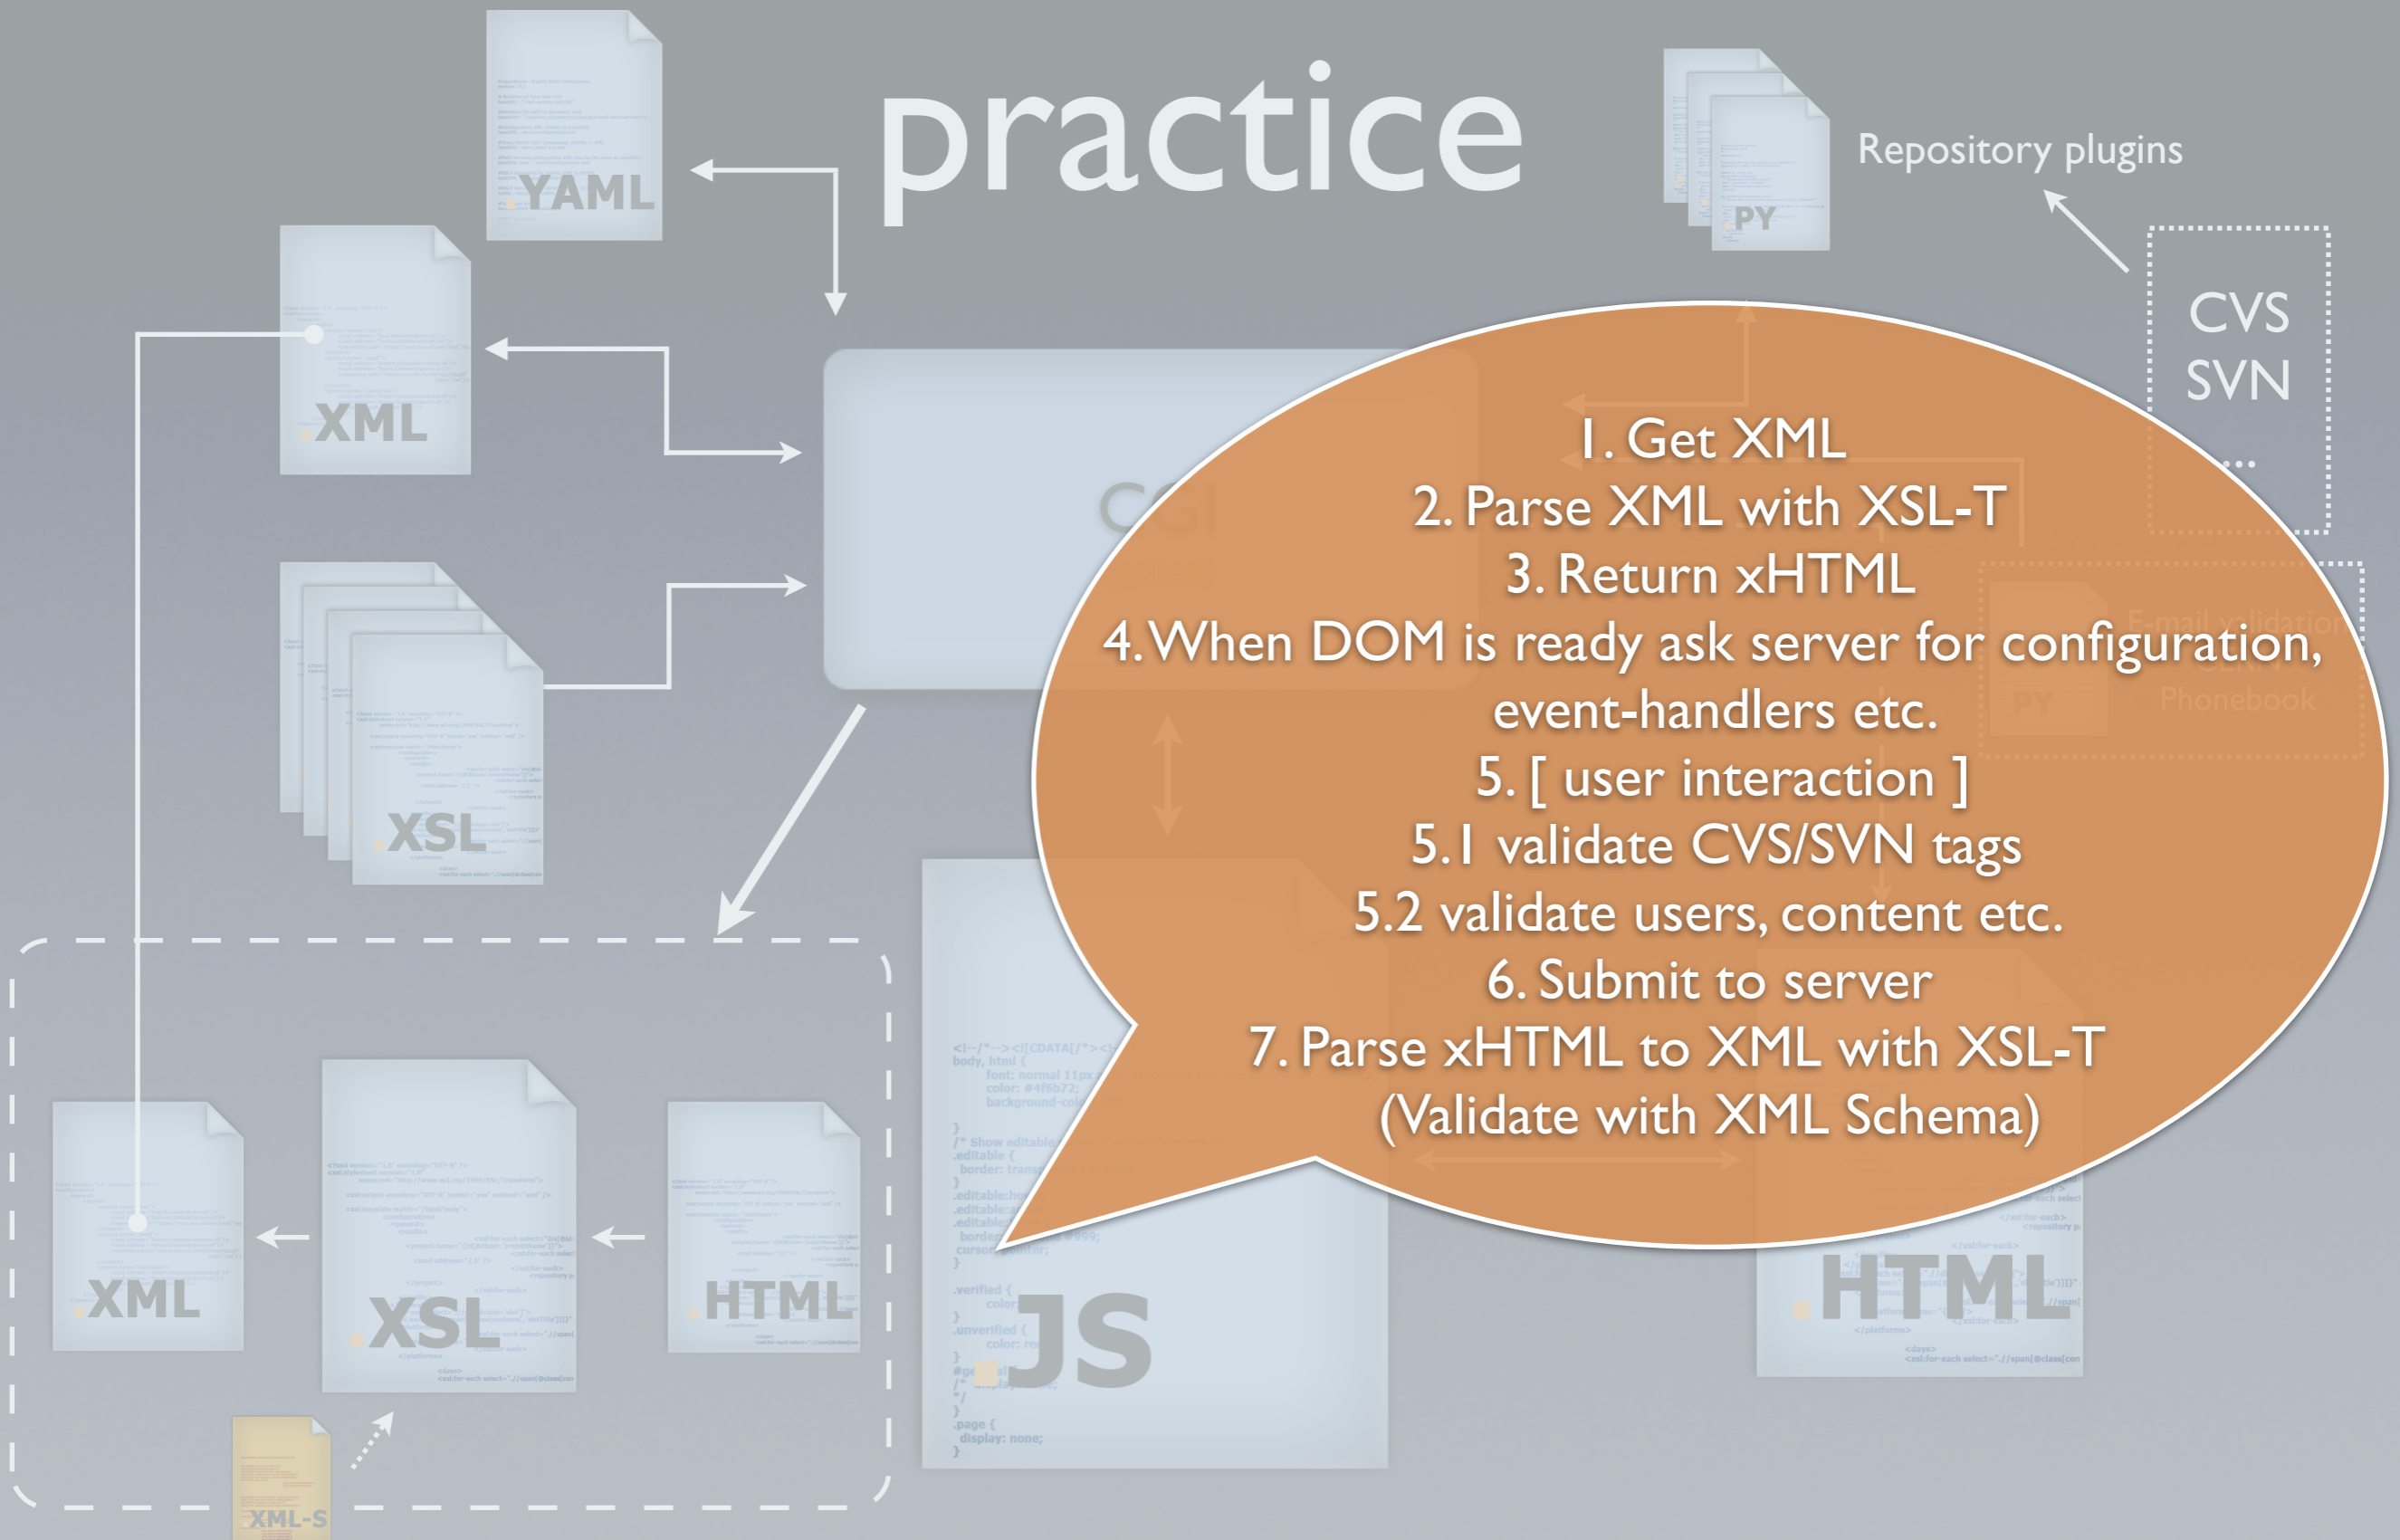

JS

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
  <xsl:output encoding="UTF-8" indent="yes" method="xml" />
  <xsl:template match="/html/body">
    <general>
      <xsl:for-each select="//div[@id=
        'project name']">
        <project name="{@class='projectName'}">
          <mailto address="{@address}" />
        </project>
      </xsl:for-each>
    </general>
  </template>
</xsl:stylesheet>
```

▶ dev2	<i>dev2 (gaudipre) Gaudi release validatio</i>	ⓧ
▶ dev3	<i>dev3 (bugfix) validating bug-fixes on top of</i>	ⓧ
▶ test	<i>test (nightlies dev) Nightlies development</i>	ⓧ
▶ release		ⓧ
▶ geant4	<i>Geant4 test sl</i>	ⓧ

New Slot

Save configuration

The Result

- (advanced) web-application
- Validation of nearly every element in the configuration file = less configuration errors
- Portable (Std. Apache-CGI+Python 2.3 >)
- Well documented (including user and developer guide at the twiki)
- Extendable (simple adding of new parameters)
- Proof of concept for new service mash-ups

Work in progress

- Nearly there... ($\lim t \rightarrow \infty \rightarrow 1$)
- PH/SFT version: feature-complete
- LHCb version: needs a little tuning
- Internet Explorer compatibility (needs new style-sheet and minor tuning)
- Better signalling (user needs to know what happens behind the scene)

You are welcome...

- Since all members of SFT currently have access through Shibboleth (changes are logged) you are welcome to have a look at the page:
